Abstract

I discuss two arguments against the view that reasons are propositions. I consider responses to each argument, including recent responses due to Mark Schroeder, and suggest further responses of my own. In each case, the discussion proceeds by comparing reasons to answers and goals.

Keywords
Epistemic reasons, practical reason, abstractionism, statism, Mark Schroeder

1. Introduction

We believe and act based on reasons all the time. But what kind of thing are these reasons? The question is interesting enough in itself. Moreover our answer to this ontological question can affect how we answer various normative questions about what makes reasons good or bad, and whether actions or beliefs based on them are justified, rational, proper and the like.¹ This paper evaluates two argu-

¹ E.g. see John McDowell, Mind and World (Cambridge, Mass.: Harvard University Press, 1994), Timothy Williamson, Knowledge and Its Limits (Oxford: Oxford University Press, 2000), Earl Conee and Richard Feld-
ments against the view that reasons are propositions, and suggests responses. I call the view that reasons are propositions abstractionism. Abstractionism’s main rival is statism, which says that reasons are mental states of the subject. I am partial to statism, and have argued extensively for it elsewhere, so this paper might well be subtitled ‘Advice to My Abstractionist Friends’. At one time I thought that each of the arguments discussed below provided evidence against abstractionism, but further reflection convinced me that they could ultimately be effectively resisted, and the present paper embodies my research in this regard. Given my preference for statism, I would be happy if what I say here in defense of abstractionism were proven wrong.

typical case of perceptual belief. You see that a chipmunk is dashing under a bush, and this prompts you to believe that a chipmunk is dashing under a bush. What is the basis of this belief? The statist says it is your perception that a chipmunk is dashing under a bush. The abstractionist says it is the proposition <a chipmunk is dashing under a bush>. (I use angle brackets to name propositions.) Or take a typical inferential belief. Suppose Sarah Palin believes that Barack Obama wants to set up “death panels,” and that if he wants to set up death panels, then he is a fiend. This prompts her to infer that Obama is a fiend. What is the basis of this inferential judgment? The statist says it is Palin’s belief that Obama wants to set up death panels, along with her belief that if he wants to set up death panels, then he is a fiend. The abstractionist says it is <Obama wants to set up death panels> along with <if Obama wants to set up death panels, then he is a fiend>. Generally speaking, whenever the statist identifies the reason as mental state M with the content <Q>, the abstractionist will instead identify it as <Q>.

Let me ward off a few potential misconceptions. First, statism and abstractionism are theories of what reasons are, not about what makes them good or bad. Second, they are not theories of reasons that there are to believe or do things. That is, they are not about what in the literature are sometimes called “normative reasons,” which are considerations that count in favor of a belief or action. Rather, as I have said, they are theories of the reasons our be-

Beliefs are based on, or as it is sometimes put in the literature, “motivating reasons.” Third, they are not general theories of the reasons why we believe things. When we believe something for a reason, then of course that reason helps explain our belief. But many things help explain our belief which are not among our reasons for holding the belief. For instance if Todd Palin deceived Sarah Palin into believing that Obama wants to set up death panels, it does not follow that Todd’s deception is among Sarah’s reasons for holding that belief, even though his deception helps explain why she holds it. Finally, despite the simplicity of the cases I used to illustrate the difference between abstractionism and statism, both theories can accommodate cases where a belief is based on multiple reasons, or multiple lines of reasoning.

The next two sections each focus on one argument against abstractionism. Each argument shares the same basic form.

Reasons are F.
Propositions are not F.
So reasons are not propositions.

If either argument were to succeed, it would be a considerable metaphysical discovery with potentially serious implications for

---

3 I hesitate to even mention “normative” and “motivating” reasons, since, in my experience, people understand the normative/motivating distinction in a disturbing number of different ways. Let me emphasize that nothing at all in my discussion turns on the “normative/motivating” terminology. See Turri, “The Ontology of Epistemic Reasons,” for more on why I think the distinction is largely irrelevant to present concerns.

4 Compare Dougherty’s presentation (‘In Defense of Propositionalism About Evidence and Therefore Against the Evidentialist Supervenience Thesis’) of Williamson’s arguments from Knowledge and Its Limits.
ethics and epistemology.

2. The Problem of Possession

The first argument is:

**Possessionless**

A1. You can have reasons.
A2. You can’t have propositions.
C. So reasons aren’t propositions.

A1 is obviously true. What about A2? It can seem absurd to say that someone *has a proposition*, and so it can easily seem that the argument succeeds. I would now like to consider a couple ways of resisting the argument, one of which I find wanting, the other of which I find more promising.

First, abstractionists might argue that we do not literally have the reasons our beliefs and actions are based on, but instead “have” them in some metaphorical sense in which it is plausible that we can “have” propositions. This strategy will not convince unless it is supported by some actual linguistic data suggesting that we are dealing with non-literal talk. But I doubt such data is forthcoming. Indeed the data suggest that ‘have’ in ‘have a reason’ is used literally.

---

5 What it is to *have a reason* has recently received attention; e.g. Mark Schroeder, ‘Having Reasons’, *Philosophical Studies* 139 (2008), pp. 57–71, and relatedly Turri, ‘On the Relationship Between Propositional and Doxastic Justification’, *Philosophy and Phenomenological Research* 80 (2010), pp. 312–326.

6 As an anonymous referee suggested.
Consider these sentences:

1. Maria has one bat she strikes baseballs with.
2. Maria has one bat she feeds live crickets to.
3. Maria has one bat she strikes baseballs with and one she feeds live crickets to.

1 and 2 both sound fine. But 3 strikes us as odd because ‘one bat’ refers to a baseball bat, whereas ‘one’ then refers to a small flying mammal. 1 and 2 cannot properly reduce and conjoin to form 3. This shows that ‘bat’ is not used synonymously in 1 and 2.

Consider also these sentences:

4. Maria swam across a river.
5. Maria cried a river.
6. Maria swam across a river, and cried another.

4 and 5 each sound fine on their own, but cannot properly reduce and conjoin to form 6, because ‘river’ is used metaphorically or idiomatically in 5 but not 4. Now consider these sentences:

7. Mario has a business.
8. Mario has several reasons for believing his business will flourish.
9. Mario has a business and several reasons for believing it will flourish.

7 and 8 reduce and conjoin to form 9. 9 sounds just fine, indicating that ‘has’ has a literal meaning either in both 7 and 8, or in neither. Since it has a literal meaning in 7, it does in 8 too.

---

Second, abstractionists might argue, as Mark Schroeder has, that by endorsing Possessionless, we succumb to a tempting mistake due to an ambiguity of ‘have’.\(^8\) Sometimes ‘X has Y’ means ‘X possesses Y’. But often times ‘X has Y’ means ‘X stands in salient relation R to Y’ (or vice versa). For example, ‘I have a father’ means that someone stands in the father relation to me. It does not mean that I possess a father.\(^9\) And of course we can stand in relations to propositions. So if we can understand ‘I have a reason’ to mean that a proposition stands in the reason relation to me, then we can deny A2.

It is true that ‘have’ generally behaves this way, and that we can stand in relations to propositions. But it is not clear that this is enough to enable a convincing response to the argument. I will first explain why this response, as it stands, might fail to convince. Then I will explain why I believe that something in the neighborhood fares better.

We can contrive contexts where it sounds okay to say ‘I have the proposition <Sarah published a book>’. Suppose you and I are playing a strange game. The game is to see who can think about their assigned proposition for the longest time. You get assigned <Barack published a book>, and I get assigned <Sarah published a book>. A third party enters and asks, ‘Who’s supposed to be thinking about Sarah?’ I respond, ‘I am. I have the proposition <Sarah published a

\(^8\) Mark Schroeder, personal communication; compare Schroeder, ‘Having Reasons’.

\(^9\) At least, it doesn’t usually mean this. One can imagine morally objectionable circumstances in which it would.
book>'. This sounds fine. Now given that we can generate this effect in the context of our strange game, if Schroeder’s response to Possessionless were correct, then we should expect it to sound okay to say ‘I have the proposition <Sarah published a book>’ when it is salient that this proposition is my reason for believing something. But that does not happen. Consider: I say, ‘Sarah published something’. Everyone asks what my reason is for thinking this. I respond, ‘Sarah published a book’. Everyone believes me. It still sounds ridiculous for me to say, ‘So I have the proposition <Sarah published a book>’. And it would likewise sound ridiculous for others to say of me, ‘He has the proposition <Sarah published a book>’. Consider a different case. Barack and Joe both believe that Sarah published something. We ask them what their reasons are for thinking this. Barack says, ‘Sarah published a book’; Joe says, ‘Sarah published a journal article’. We all believe that they are being sincere. Now someone asks, ‘So which of these two gentleman has the proposition <Sarah published a book>?’. The question is unintelligible. But it would not be unintelligible if the abstractionist proposal currently under consideration were true.

Let me put the worry slightly differently. Even when the reason relation is salient — because, say, we have just been asked what our reason is for believing Sarah published something, and we respond by saying ‘She published a book’ — it still sounds awful to say ‘I have the proposition <Sarah published a book>’. We can think of other contexts where it makes sense to say that you have that proposition, contexts where we could understand what relation ‘have’
Reasons, Answers and Goals

picks out. (This is the point of my “strange game” example above.) But it makes no sense in the context of the reason relation. Why would that be, if the reason relation relates us to the proposition in question, and that fact is very salient in the context? Why would ‘have’ have such a hard time picking out the reason relation? Why can’t we hear it that way?

That is one basis for being dissatisfied with Schroeder’s response. But lurking in the neighborhood is a related, complementary, and perhaps more effective response.

The alternative response features the locution ‘have, as an F’. We can say things like ‘I have, as my answer, the number 2’ and ‘I have, as my main goal, a cure for malaria’. Save for special contexts, from those statements we cannot infer either ‘I have the number 2’ or ‘I have a cure for malaria’. Likewise, from the statement ‘I have, as my reason, the proposition <Sarah published a book>’, we should not expect to be able to conclude ‘I have the proposition <Sarah published a book>’.

Returning now to Possessionless, we can see that it straightforwardly begs the question, provided that ‘have’ is understood in a way relevant to the debate over the nature of reasons. In order to ensure that ‘have’ refers to the relevant relation throughout, we need to read it like so:

A1’. You can have, as reasons, reasons.

A2’. You can’t have, as reasons, propositions.

C. So reasons aren’t propositions.
But then A2’ obviously begs the question.¹⁰

I have one residual worry about this latest response. Once it is clear that we’re talking about the answer relation or the goal relation, we can hear the unadorned ‘have’ as predicating the relevant relation. So if I say, ‘I have, as my answer, the number 4. What about you?’, you can respond, ‘I have the number 8’. That sounds fine — we unproblematically hear it as involving the ‘have, as an answer’ relation. And if I say, ‘I have, as my goal, a cure for AIDS. What about you?’, you can respond, ‘I have a cure for malaria’. We hear this as involving the ‘have, as a goal’ relation. But if I say, ‘I have, as my reason, the claim that she published a book. What about you?’, it is not entirely clear that you can felicitously respond, ‘I have the claim that she published an article’. It is not clear that we hear this as predicating the reason relation, or even whether it is acceptable.¹¹ Perhaps we must always say ‘I have, as my reason’ to hear it as predicating the reason relation. It is an open question how significant this disanalogy is between reason-talk on the one hand, and answer-talk or goal-talk on the other.

3. The Problem of Powerlessness

Here is the second argument.

---

¹⁰ Perhaps ‘have’ always means ‘have, as an F’. If so, all the better for the response to Possessionless just sketched. But the response does not require this. It is enough that the abstractionist can liken talk of having reasons to other respectable ‘have’-talk, such as having answers or goals.

¹¹ My correspondents are ambivalent on the question.
**Powerless**

B1. Reasons are causes.

B2. Propositions don’t cause anything.

C. So reasons aren’t propositions.

Why accept B1? Because reasons must explain the attitudes based on them, and the best account of reasons’ explanatory role is that they are causes, so reasons are causes.\(^{12}\) Why accept B2? Because propositions are non-spatiotemporal objects, and all non-spatiotemporal objects are causally powerless, so propositions are causally powerless.\(^{13}\) Notice how easily statism accommodates the causal profile of reasons: mental states can cause one another, and reasons just are mental states, so reasons can be causes.\(^{14}\)

Abstractionists might object to the argument for B1. They might dispute the claim that the best account of reasons’ explanatory role is that they are causes. It is natural to think that this would require defending an alternative account of their explanatory role. But progress on this front has been minimal.\(^{15}\) However there is an alterna-

\(^{14}\) I take it that something like this line of thought helps motivate Davidson’s identification of a “primary reason” as the combination of “a belief and an attitude” (later: an “intention”), given that Davidson thinks that reasons explain action by causing it; see ‘Reasons, Actions, and Causes’, pp. 6–11.

The strategy is to claim that although it is true that your having the reason must cause your belief, it is not true that the reason itself must cause your belief. It is a subtle distinction between a reason causing the belief and your having of the reason causing the belief, and because everyone agrees that you must have a reason in order for your belief to be based on it, the abstractionist can explain why many people have mistakenly thought the causal theory seemed so obviously true.

The strategy is interesting, though there is some reason not to be entirely satisfied with it. First, after carefully considering the proposal, I find it implausible that I am making the mistake it attributes to me. I doubt that I would mistake the causal efficacy of having a reason for the efficacy of the reason itself, any more than I would mistake, for example, the causal efficacy of having a dog for the efficacy of the dog itself. This is especially true in a context where the potential mistake has been explicitly suggested, and we are on alert. Second, the proposal says, ‘while it is true that your having the reason must cause your belief, it is not true that the reason itself must cause your belief,’ but abstractionism actually entails something much stronger. If abstractionism is true, then not only is it true that reasons need not cause your belief, it is also true that reasons could not possibly cause your belief, or anything else for that matter. This consequence is much more difficult to accept than the relatively modest claim that sometimes reasons explain by

---

16 An anonymous referee first suggested this strategy to me. See also Schroeder, Slaves of the Passions, ch. 1.
virtue of a non-causal relation, which is the most formidable response to B1, and the most popular one in the literature on causal theories of reasons for both action and belief.\(^\text{17}\)

But I will set aside these worries, since my main concern presently lies elsewhere. I think this new suggestion for responding to B1 could be bolstered by producing analogous cases where the having of X causes Y, but X itself does not. For unless we find such analogs, the strategy will look like special pleading, resting on a radical and unprecedented causal asymmetry between the having of X and X itself. And here I think we might once again profit from comparing reasons to answers and goals.

My having the answer to a question might cause me to win a prize, but the answer itself, '<Topeka is the capital of Kansas>', does not. My having the goal of curing malaria might cause me to study parasitology, but the goal itself, *to cure malaria*, does not. In each of these cases, it seems that my being in a certain state with a certain content — my believing that Topeka is the capital of Kansas, and my aiming to cure malaria — causes the relevant outcomes, even though it is implausible that the abstract representational content of those states could cause anything.

\(^{17}\) An anonymous referee asks, ‘If you already accept that reasons are not causes, why would you be bothered by the implication that in no possible world reasons are causes?’ I do not see it as my aim here to convince such a person. My point is that opponents of the causal theory of reasons have, by and large, responded by arguing that it is possible for some reasons to explain non-causally. (B1 is supposed to be a necessary truth about the nature of reasons, so a possible case would be enough.) But no clear example of such a case has been offered, despite much effort. This would be surprising if reasons necessarily explain non-causally.
4. Conclusion

The analogy between reasons on the one hand, and answers and goals on the other, offers aid and comfort to abstractionists. Further benefit is gained by pointing out how natural it is to speak of our beliefs and actions as being based on answers and goals, e.g. ‘His belief is based on the answer to the previous question’ and ‘Her actions were based on her goal to finish at the top of her class’. One satisfying outcome for abstractionists would be for reasons to just be answers and goals.¹⁸ They might do well to explore this possibility further.¹⁹

¹⁸ In the final analysis, preferences will probably also feature in the account.
¹⁹ For helpful feedback and advice, I happily thank Thom Brooks, Don Hubin, Clayton Littlejohn, and two generous and astute anonymous referees. Special thanks go to Angelo Turri and Mark Schroeder.
